“Adding acoustic treatment is probably the easiest and most effective thing you can do to improve your sonic environment.” Home Theater, May 2003

Dollar for dollar, there is no surer way to improve a sonic environment than through acoustical treatments. That's because the incremental gains possible with upgraded audio gear are dwarfed by the fundamental gains ensured by proper acoustical treatment. However, the prospect of a home theater or listening room studded with unsightly fabric panels is an interior designer's nightmare. **But what if those panels looked like artwork?**

Living Sound™ panels dispel the myth that absorption panels cannot be attractive additions to a room. Using a unique fabric printing process, favorite photographs and paintings become the elegant covers for high-quality absorbers that will dramatically enhance your listening experience. Choose from stock images of artwork or photography, or supply your own high-resolution file. Living Sound™ panels are available in a wide variety of sizes, and a matte can also be printed into the panel.

- High-quality acoustic absorber doubles as artwork
- Removes reflections and echoes for clearer sound
- High degree of absorption down to 500 Hz
- Dramatically enhances the listening experience
- Choice artwork or photography printed onto fabric
- Variety of frame styles to match the décor
- Just 1 inch deep and hangs like a painting
